

PREVENTIVE EXAMINATION FOR WOMEN

For every woman who has decided that now is the time to look after herself and would like to check her »female« health.

DIAGNOSTIČNI CENTER BLEĐ

For a healthy and enjoyable life!

PREVENTIVE EXAMINATION FOR WOMEN

A woman is strong, independent, ambitious... loving, tender... almost unstoppable. Her female body gives life, but has its own principles and needs. Do not neglect it!

We have developed a special preventive examination for all women encompassing the crucial medical examinations with which you can check your »female« health.

- gynaecological examination & gynaecological ultrasound,
- PAP test with cytology,
- breast ultrasound,
- laboratory analyses (Blood: sample collection, haemogram with a differential blood count, sedimentation, hepatogram – liver condition indicators (AST, ALT, GGT, AF, bilirubin), electrolytes in blood (potassium, sodium, chlorine, calcium, phosphorus), kidney condition indicators (urea, creatinine, uric acid), pancreas tests (amylase, lipase), blood sugar – glucose, lipid profile – blood fats (cholesterols, HDL, LDL, triglycerides), CK, LDH, iron, TIBC, proteins, albumins, prothrombin time, INR, thyroid hormone – TSH, vitamin D. Urine: basic analysis and sediment),
- ultrasound of abdominal organs,
- ECG & spirometry,
- an examination by a specialist in internal medicine, including an opinion.

The preventive examination has been developed for women

- who are deciding to start a family and need to make sure that their body is healthy and ready for pregnancy,
- who have cases of reproductive system and/or breast diseases in the family,
- who want more than merely a gynaecological examination,
- who want to check their health quickly and in one place.

The preventive examination for women takes place in one place at our premises in Ljubljana and takes approximately 4 hours. Dedicate those hours to your health! **The examination is performed on a completely empty stomach.** It includes a complimentary lunch break.

Brief information about the programme

The gynaecological examination with ultrasound and a PAP analysis allows a simple checkup of any changes in the cervix, vagina, on the ovaries and in the uterus, including the presence of the HPV virus. Breast ultrasound is used to establish any cancerous and other changes in the breast tissue. Additionally, the underarm lymph nodes are checked. The extensive lab tests are used to determine the full blood count, hepatic, kidney and pancreatic as well as thyroid function while also evaluating the electrolytic balance, blood iron, glucose and cholesterol levels. Abdominal organs (liver, gall bladder, pancreas, spleen, kidneys, major abdominal arteries, urinary tract, reproductive system) are extensively examined by means of ultrasound, whereas the heart rhythm and heart muscle function are checked by means of an ECG. Spirometry is used for measuring lung volumes and for the assessment of the lung function allowing us to distinguish between the symptoms of lung or heart diseases. Together with a specialist in internal medicine we will thoroughly discuss your health condition.

Under the Slovenian ZDDV-1 Act the VAT (Value Added Tax) is not charged for medical services.

PRICE: **495.00 EUR**
